# Jaren Kempton

Senior Full Stack Engineer | Developer Experience, Platform & AI Tooling

(480) 304-2061 | jaren.kempton@gmail.com | jarenkempton.dev | github.com/JarenKempton | linkedin.com/in/jaren-kempton | Queen Creek, AZ (Remote)

## SKILLS

**AI & agents:** MCP (Model Context Protocol) servers, AI agents, LLM tool calling, agent and retrieval evals, hybrid RAG (BM25 + vector + reranking), agent guardrails, Claude Code, Hermes

**Developer platform:** CI/CD, GitHub Actions, self-hosted runners, internal tools, Docker, GCP, Cloudflare Workers, Vercel, Temporal, Playwright, Vitest, TDD, observability (Sentry, Datadog)

**Backend:** TypeScript, JavaScript, Node.js, Bun, Hono, NestJS, REST APIs, GraphQL, tRPC, event-driven systems, message queues, webhooks, background jobs, PostgreSQL, MySQL, SQL, Supabase, Drizzle

**Frontend:** React, Next.js, HTML/CSS, Tailwind CSS, Storybook, design systems, Base UI, MUI

## EXPERIENCE

**Symphosize | Technical Consultant (Part-time) | Jun 2026 – Present**

- Interviewed every developer, designer, and product and project manager, and analyzed 12 months of Jira and deploy data, to find why the product shipped slowly and with bugs: context was lost between teams, with no QA gate.
- Co-designed with the CEO and architected the cross-functional **product pipeline** built to fix it: locked scope and decisions, public questions with owner-locked answers, and QA gates from epic to release; **21 projects launched** through it. Leading the backend re-architecture, consolidating logic from edge functions, raw SQL and route handlers into **one typed action layer (283 actions across 18 domains)** that serves the UI, API and MCP tools with permissions defined once, plus release-time migrations and a 201-test harness.
- Created and solely own the **company knowledge service** that answers code, business-logic and customer questions for agents over MCP. Gave an AI agent a sandbox, held-out evals and dedicated compute to optimize search on its own: it **cut p95 latency 4x** (27.6 s → 6.7 s) and built a hybrid search with **~70% better ranking** on labeled real queries, shadow-tested beside production for 5 days before cutover.
- Encoded the architecture as CI-enforced conventions and moved heavy CI to self-hosted runners; authored or merged **~30 PRs per weekday** (690 in 30 days), mostly AI-assisted.
- Sole creator of a **durable Temporal workflow** that turns Sentry errors into reviewed fix PRs and reviews non-engineers' PRs against the architecture to prevent sprawl; auto-merge of validated fixes is in testing.

**SalesAi | Full Stack Developer | Feb 2026 – Oct 2026**

- Consolidated duplicated frontend and admin components into **one React 19 / Base UI library (40+ components)** realigned to the Figma design system; built a Figma export plugin and token generator, and prototyped drift checks and design-to-code PR sync.
- Hardened security by migrating Twilio credentials to **AES-256-GCM encrypted storage** across 3 services and 5 environments via dual writes and verified backfill.
- Added SMS to a voice-first workflow builder; built setup, number management and rollout for Commio as a second phone provider.

**The Church of Jesus Christ of Latter-day Saints | Full-time Volunteer Missionary | Oct 2023 – Oct 2025**

**Technology Specialist | Sep 2024 – Oct 2025**

- Hand-built, before AI tools, a TypeScript and Google Maps API tool on Apps Script that planned the mission president's interviews every 6 weeks with the least travel, routing companionships with cars to pick up those without.
- Supported 150+ missionaries' phones, including a mission-wide SIM card swap and short-notice repairs; maintained Rust software analyzing 1,000+ records weekly and automated 100+ weekly emails and texts.

**ResponsiBid | Junior Developer | May 2022 – Oct 2023 (Developer Intern, May 2021 – Jul 2021)**

- Worked in the legacy PHP (CakePHP) and MySQL platform, including production migrations and debugging, while helping build its TypeScript replacement in React/Next.js and NestJS GraphQL.
- Helped introduce TDD in an Agile team, raising test coverage in a **1.2M-line codebase from 0% to 24%**.

## OPEN SOURCE

- interlock: TypeScript/Bun CLI that claims unblocked Jira tickets and sets each up as an AI-agent lane in a Git worktree.
- quench: profiles coding-agent sessions to show why agents get corrected, and scans local files for leaked secrets.
